Fig. 7.—Plan of Upper Rookhope and the Hunstanworth-Rookhope watershed. A number of veins have been worked in the Rookhope Valley, but only one, the highly productive Boltburn Vein, has been followed through the watershed. An untested stretch of Red Vein, 8250 ft long, remains between Boltburn and Groversike mines. Development of this would provide a means of access to veins nearer the watershed. Based on data from Weardale Lead Co., Ltd., records. Figures give elevation of the base of the Great Limestone above Ordnance Datum in feet.
